

Sprint 1 Reflection

Name: Abhiram Makkapati

In Sprint 1, I learned how to use Git better and made sure my setup was correct. I created a branch with my name, made changes, and merged them back to the master branch. I also practiced deleting and creating branches again so I could fix mistakes. I pushed a README file to the repo, which helped me test that everything was working. One problem I had was with branches. I made too many with similar names and had trouble deleting them. At first, this was confusing, but then I looked up the right commands and fixed it. Sometimes I also forgot to stage the correct files before committing. To fix this, I started using git status before every commit. And another thing for us is, It would be better if we communicated faster, since it took us some time as a team to get connected. We had a slow start, but once our ideas aligned, things began to move in the right direction. I learned many small but useful things in this sprint. I now know how to make commits, use branches, push changes, and clean up when something goes wrong. I also see how important it is to write clear commit messages and keep work organized. For next time, I want to make smaller commits and explain them better. Some of my commit messages were too short, and that made it harder to remember what I changed. I will try to write clear notes and keep my work neat. This will make it easier for me and for the team.
