

Jordan Bussa

During this first sprint, my main contribution was creating a model app with the help of an AI tool. This prototype gave us a clear vision of how the project should look once finished and how the different functions would work together. By putting together this model, I was able to translate our initial ideas into something more visual and functional, which made it easier to communicate the direction of the project. Even though this was only the first sprint, it will help provide a strong foundation for the team's future work.

One of the challenges I encountered was getting used to GitLab. Since I had a little experience with it, I initially found it difficult to understand how to navigate the platform and complete essential tasks such as creating branches, making changes, and committing them. At first, it felt overwhelming, but as I explored and practiced, I became a little bit more comfortable with it. As of now, I can handle the basics.

This sprint also allowed me to learn several new skills. I gained hands-on experience with Git Lab by practicing how to create new feature branches, make edits, and commit changes. I am also learning HTML, which I will apply to the project. These skills, even though small, are skills that will continue to improve as the project progresses.

Looking back, I recognize that communication is the main area where I can improve. I tend to keep my ideas to myself when I am not confident and work on them on the side until I am more confident that the idea is good, which limits my contribution to the group's discussion. For the good of the team, I want to be more proactive in speaking up, asking questions, and sharing feedback so that I can contribute more fully. By improving my communication, I can ensure that my ideas, along with the skills I am building, have a stronger impact on the overall progress of the project.
