

Sprint 1 Reflection

During Sprint 1, I took the initiative to establish a communication outlet for my teammates by reaching out first and coordinating which platform we would use. I made it a priority to include everyone's perspectives during idea planning, ensuring that each member had the opportunity to contribute. For our pitch, I contributed to drafting the script for our video and did the editing of our recording. My key individual contributions to the team's progress centered around keeping the group together and organized, on track, and ensuring that every voice was heard.

The main challenge I faced during this sprint was the lack of consistent communication from some teammates. Even though I encouraged everyone to share their ideas, many were hesitant to speak up, which left our group divided on how to move forward. As a result, our first pitch scored poorly due to the absence of a shared vision between us. To address this, I suggested holding a dedicated group meeting to stress the importance of open communication and strongly encouraged my teammates to express their thoughts. This discussion helped us align as a team and establish a clearer scope for executing our web application.

From Sprint 1, I gained valuable insight into many different languages and frameworks that can be used to build a web application while researching which ones best fit our project. One tool that was completely new to me was Firebase. Since it offers features like database management, authentication, and hosting, I am excited to continue learning more about it and applying it to our project.

One area for improvement would be holding more in-person group meetings. I find that meeting face-to-face is often more productive for discussing ideas, concepts, and next steps compared to texting or even voice call. While I would prefer this approach, I also recognize that scheduling regular in-person meetings can be challenging since we all have classes, jobs, and other commitments.
