In this sprint, my main accomplishment was connecting with my teammates to reach a final understanding of our project direction. I actively contributed by suggesting several ideas to improve our design and expand its functionality. While not all of my suggestions were approved by the professor in the initial pitch, the process taught me the importance of prioritizing what aligns with the project's main goals. I also recognized that some of the ideas I proposed, although creative, were too ambitious to implement within our time frame and not directly relevant to the core feature. This realization helped me focus more on what was feasible and essential.

Another contribution I made was helping to prepare our pitch. I worked on putting together the slides and also drafted part of the script. This gave me the chance to present our ideas in a clear and organized way and ensured that the team had a strong foundation for our presentation. Collaborating on these tasks allowed me to strengthen both my communication and organizational skills while supporting the team's overall progress.

The main challenge I encountered was learning how to balance my enthusiasm for contributing ideas with the need to stay grounded in the project's scope. At times, I felt frustrated when certain suggestions were not approved, but I learned to see this as part of the refinement process. By listening to my teammates and the professor's feedback, I was able to adjust my perspective and focus on what was most valuable for the project.

Through this sprint, I learned that teamwork is not just about contributing as many ideas as possible, but also about filtering and prioritizing ideas so the team can move forward effectively. I also gained experience in developing slides and presentation scripts, which are valuable skills for communicating technical and design concepts.

If I could improve, I would work on refining my ideas before presenting them, so that I suggest fewer but more targeted contributions. For the team, I think we could improve by clarifying roles earlier, which would make our workflow smoother and reduce overlaps. Overall, this sprint was a strong learning opportunity, and I feel better prepared to contribute in the next phase.
