Sprint 2 Reflection

For this sprint, I worked on the frontend part of our project, focusing on the registration page. I had no previous knowledge or experience with Flutter or Dart before starting this sprint, so it was a very new challenge for me. To get started, I used online learning resources such as YouTube and Udemy to understand the basics. Even though I could not learn everything in such a short time, I applied whatever I understood from those videos directly into my work on the project.

This was the hardest task for me so far because I struggled with both the framework and the time limit. Since I was still learning the language and tools while trying to code, it took me much longer than I expected. I dedicated most of my effort just to this registration page, since I wanted to make sure it was functional and matched the needs of the project.

One thing I learned during this sprint is that even if I don't fully know a language or framework, I can still make progress by breaking things into smaller parts and applying what I have learned step by step. I also realized the importance of time management because trying to learn and code at the same time was stressful. Moving forward, I want to start learning earlier so that I can feel more confident and contribute more effectively to the project.
