

Sprint 2 Reflection

During Sprint 2, I set up ClickUp to organize our product and sprint backlogs immediately after our customer meeting. Once everyone chose their tasks, I documented and assigned them on the Sprint 2 backlog. Since my team was unfamiliar with Flutter and Firebase, I also shared resources to help us learn. With my new knowledge, I completed my task, which allowed users to upload photos of clothing items by either taking a picture or using their gallery, and storing them in the database for later viewing.

A major challenge I faced this sprint was poor communication. Our customer meeting was on Friday, leaving only a few days to work. On Saturday, I asked my teammates if they had successfully set up Flutter and Android Studio. Only one person responded. Most of the group didn't mention their issues with Android Studio until Sunday, leaving very little time before the deadline. I shared tutorials that had helped me, but one teammate still struggled, and there was little more I could do given the time and communication constraints.

I personally learned a lot about Flutter through Net Ninja's YouTube playlists, particularly "Flutter & Firebase App Build" and "Flutter Crash Course." These taught me how Flutter uses widgets for layout and how to create interactive buttons. However, I couldn't fully explore Firestore integration since the registration team hadn't finished their part at the time. Instead, I created mock files to simulate Firestore offline.

One improvement I need to make is starting work earlier. I underestimated the time required to set up Flutter, Android Studio, and Firebase. On Saturday, I spend hours just setting up my system, leaving me to cram all the coding on Sunday. Moving forward, I plan to begin as early as possible to leave room for unexpected technical or group issues. Ideally, this will help me balance my own workload while supporting teammates more effectively.
