

Sprint 2 Review

For the second sprint, each group member had their part of the code they were responsible for. While two of us had to work together and work on the frontend and backend of the registration page, one was responsible for the login page, and two others had to implement the photo import and background removing program into the app. Dividing the tasks between the five of us dramatically reduced the amount of pressure we had on learning more on the framework and language. All in all, we all managed on completing each of our code.

Compared to the previous sprint, this one proved to be harder with more challenges than any of our group members had anticipated. The first obstacle we came across was time. For sprint 2, we had to meet with the professor to discuss our user stories and what we planned on doing. With less than one week to decide on a time that would work for all five of us, meeting up with the professor seemed almost impossible. First, we agreed on meeting up with him on Thursday, after class at four. A couple hours after booking our agreed upon time slot, we were informed that someone else had reserved the same time. So, we addressed our concerns with the professor, and he offered to meet with us later at around four-thirty. After waiting in the library for about two hours after class, we received an email from the professor notifying us that he wasn't available at four-thirty because he had a class and that we should reschedule. In a hurry, we consulted each other and decided on finally meeting on Friday morning at eleven. After the meeting, we only had three days to work on our individual parts of the code. Because we had to work on it over the weekend, all of us were available at different times, so we couldn't meet and had to make most of the time we had. Everyone finally managed to complete their part of the code after working on it late at night for two days. Another setback we experienced was that no one in our group had any experience on creating an app before nor did anyone know how to use the framework and language we agreed on utilizing to create our app. So, we decided on watching YouTube courses on Flutter(framework) and Dart(language). Due to the lack of time as mentioned before, it was harder to cram in a whole course in two days and code simultaneously, but we successfully got it done.

Meeting with our client really helped in clearing a lot of confusion our group had regarding the sprint and how we start our coding our app. Originally, we planned on utilizing React, Node.js, and Firebase, but after consulting with the client, we learned about Flutter, an opensource, UI framework created by google. He suggested on working with Flutter and learning Dart, a programming language, because they were better suited to be used to create our app compared to what we had planned on using. It would also

give us an advantage as we wouldn't have to learn as many software development tools as we had thought.
