

Sprint 3 Reflection

During Sprint 3, I was responsible for connecting the upload feature of our application to Firebase and implementing a delete feature for uploaded items. After our customer meeting, I also took the initiative to set up our user stories based on the feedback and expectations shared by our customer and updated our product backlog on ClickUp to ensure our tasks and priorities are up to date. To help maintain organization across the team, I created a document outlining which files should be placed in which folders. This was meant to ensure everyone's workspace followed the same structure and to provide a reference for anyone who became disorganized with file management.

Overall, this sprint went much more smoothly than our previous ones. Our communication as a team improved, and our meetings were much better organized. In earlier sprints, we had trouble finding times that worked for everyone, but this time we were more flexible and proactive in scheduling. However, one issue that arose was that one of our group members did not commit anything to the master branch during this sprint. The rest of us communicated regularly in our group chat, updating each other on our progress and when we committed our work. Because of that, it was disappointing to not see a commit from that member or any communication about their progress.

From a technical perspective, I learned a lot about Firebase during this sprint. I gained a clearer understanding of the difference between Cloud Firestore and Cloud Storage, both of which our project uses. I learned that Cloud Storage is best suited for storing the clothing images users upload, while Cloud Firestore is used for structured data in the form of JSON-like documents. This distinction was initially confusing, but I now feel much more confident working with both tools.

Looking ahead, I plan to improve by committing my work more frequently throughout the week rather than waiting until the end of the sprint. I previously thought commits should only be made after completing a finalized feature, but now I realize that I should be committing incrementally throughout the week. For future sprints, our team can also improve by continuing to communicate consistently about progress, ensuring everyone remains accountable and informed.
