

Sprint 3 Reflection

During the previous sprint, I focused on implementing the connection between the registration screen and the home screen, reflecting the user story that a newly registered user should be directed straight to the home screen instead of having to log in. This feature was important because it streamlined the user experience, ensuring that users who had just provided a large amount of information could begin interacting with the app immediately. Individually, I contributed by integrating the navigation logic, testing the transitions, and making sure that the data from the registration form was correctly passed to the home screen.

While working on this, I encountered several challenges. First, I had to work with and continue from code written by other team members, which introduced difficulties because not all dependencies were installed on my local machine, and some functions did not correspond exactly to the way I expected. Additionally, I ran into issues with missing directories and mismatched paths, which caused runtime errors and slowed progress. To address these problems, I carefully reviewed the project structure, ensured that all dependencies were installed and up to date, and consulted with teammates to verify function definitions and correct usage. This process required patience, debugging, and effective communication to align my changes with the existing codebase.

Through these experiences, I learned several valuable lessons. I gained a deeper understanding of navigating and integrating a shared codebase, including best practices for pulling and merging code, managing dependencies, and troubleshooting errors that arise from differences in development environments. I also improved my skills in debugging complex issues that involve multiple team members' code and learned to anticipate potential conflicts when integrating features. Additionally, I gained insight into collaborative workflow strategies, including the importance of clear communication and frequent code reviews to maintain consistency.

For the next sprint, there are areas I could improve both individually and as a team member. I could improve my preparation by ensuring that all dependencies and environment setups are fully synchronized before integrating new features. From a team perspective, we could benefit from clearer documentation of functions and directory structures to reduce confusion when multiple people are working on connected features. Additionally, implementing more structured code review and merging processes could help prevent the issues I encountered and allow us to progress more efficiently.
