

Sprint 3 Reflection

For this sprint, I worked on improving the user authentication flow and updating the registration page UI to make the app look cleaner and more secure. I developed the automatic logout feature that logs users out automatically when the app is closed unless they select the “Remember Me” option. This was done using Firebase Authentication and local storage to manage user sessions. I tested it multiple times to make sure everything worked smoothly and users could stay logged in safely when they chose that option.

I also worked on the registration page and made several improvements to its layout. I fixed the spacing, adjusted the alignment, and made sure all input fields like name, email, and password were connected properly with their controllers. I also verified that the validation worked correctly so users couldn't submit incomplete or invalid information. This helped make the registration process easier and more professional.

During this sprint, I did my work a bit on and off and ended up committing my code later than planned. Even though I was a little late, I made sure everything was finished, tested, and ready before the sprint ended. Our team communication improved a lot this time — we kept each other updated more often, which made it easier to stay on track and finish our parts properly.

In this sprint, I learned more about how Firebase Authentication connects with Firestore and local storage to manage login sessions. I also got more comfortable with linking backend logic to frontend UI in Flutter. Going forward, I plan to commit my work more regularly throughout the week instead of waiting until the end. In the next sprint, I want to focus on connecting the authentication with other pages like the main menu, upload photo, and closet view. My goal is to stay consistent, communicate better, and help
