

Sprint 3 Reflection

As an individual, I accomplished a lot during this sprint. In the previous sprint, I was in charge of creating a program that automatically removes the background from images imported from the phone or taken from the camera. Since my code was connected to one of my team member's codes that she was working on at the same time, I couldn't connect my code with hers. So, in this sprint I connected my class with my teammate's code. After that, I set on my next goal—automatically logging out the user when the app is closed. After adding the code snippet that auto logs out the user to main, I added a method that checks the status of the user's authentication to figure out what screen to present.

At the start, I encountered a challenge right away. My background removing code wasn't working. I ran into so many problems, I had to redo my entire program from scratch. For some reason, my previous program had issues connecting with the rest of the application, so, I rewrote my whole class. This took up so much precious time I could've used to put in more effort into this sprint's work. After redoing all my previous sprint's work, I added onto my teammate's upload photo class so that the class takes a photo and sends it to my class to get the background removed. Once it reached the end of my class, the photo would then be sent back to the upload photo class to create a clothing item. In the end, I managed to fix last sprint's mistake and finish this sprint's work within the due date. I was proud of finally successfully implementing a background removing class.

This sprint helped me realize not everything goes according to plan. While I had planned on working on this sprint's task, because I ran into problems from my previous sprint, I had to push back my future goals and fix the broken code first. This sprint also helped me gain better time management as well problem-solving skills. I also learned how to effectively debug code and fix specific errors.

I could've done better by managing my time. Because my background removing code couldn't properly work, I spent a significant amount of time redoing my previous hard work instead of focusing better this sprint.
