

SPRINT 3

Jordan Bussa

During this sprint, I focused on the backend part of the login. Using Firebase I developed and refined the authentication for our project. I implemented Firebase Authentication to enable user login functionality, configured Firestore to store user profiles, and between the app and backend.

One of the main challenges I encountered involved configuring Firebase and resolving Gradle build errors in Android Studio. I initially struggled with plugin compatibility and dependency conflicts between different Firebase packages. I learned how to properly modify the Gradle files, manage 'pubspec.yaml' dependencies, and connect the project to the Firebase console.

Our teamwork has improved a lot compared to previously. We meet more frequently and make more calls, which helped us plan ahead with clear goals. We shared progress updates in the group chat and were more proactive about helping each other.

This sprint taught me lessons about project configuration, debugging workflows, and version control. I gained hands-on experience integrating cloud-based authentication, managing flutter dependencies, and troubleshooting cross-platform issues.

If I could improve something for the next sprint, I would focus on time management and commit more frequently on Gitlab instead of waiting until major milestone. I plan to document each fix and commit with clearer notes, as well as testing before pushing updates. This sprint helped me grow technically and strengthened my ability to collaborate effectively with the team. As a team, I believe we can improve by maintaining more consistent documentation of progress between meetings. Overall, this sprint helped me grow both technically and collaboratively.
