

Reflection

During this sprint, my main focus was improving the closet screen filters in our StyleSync application. I worked on designing and implementing a feature that allows users to easily sort and view their clothing items based on different criteria such as Color, Brand, and Occasion. I placed the new Filter button next to the Accessory button at the top-right corner of the page to maintain visual balance and consistency with our theme. When clicked, the button displays an interactive dropdown with filter options that users can select to organize their closet items. I also removed unnecessary elements like size options to simplify the layout and make the interface more intuitive.

One challenge I faced this sprint was managing the UI alignment and state updates when expanding and collapsing the filter options. At first, the filter menu overlapped with other components, and the changes didn't update smoothly across the screen. I spent extra time testing different widget combinations and using Flutter's state management tools to make sure the filters worked correctly without affecting other sections. Debugging these layout issues was frustrating, but I learned to test each feature step by step instead of rushing through multiple changes at once.

Through this sprint, I learned how important UI consistency and responsiveness are in mobile app development. I learned more about widgets like ExpansionTile and PopupMenuButton and how to maintain a clean user experience even when multiple interactive elements are involved. This experience helped me understand the balance between functionality and design, which is something I want to keep improving in future sprints.

For improvement, I plan to commit my code more frequently and manage my work in smaller portions instead of completing everything near the end. I also want to spend more time learning about Flutter animations and transitions to make our app feel more dynamic and professional. Overall, this sprint helped me strengthen my design and problem-solving skills while contributing to a key interactive feature in our project.
