

Sprint 4 Reflection

During this sprint, my main responsibility was implementing the feature that allows users to view clothing items by category. When a user clicks on a category (top, bottom, or shoe) they are redirected to a page displaying all items within that chosen category. This page also serves as the main area where users can apply filters and plan outfits based on their selected preferences. After our customer meeting, I also updated our product backlog on ClickUp with new user stories to ensure that our tasks and priorities were aligned with the customer's feedback and expectations.

One challenge I encountered this sprint was during group discussion about how to move forward with our user stories and the overall app design. At times, not everyone was available during these meetings, which made it harder to have a complete and cohesive discussion. However, with two of my teammates, we were able to talk productively and clarify how we wanted to structure the user stories and approach the sprint tasks. Moving forward, it would be more efficient to have all team members present so that information doesn't have to be repeated and everyone can share their input in real time.

A key insight I gained this sprint was how complex filter systems can be, especially when considering database design. During our customer meeting, we discussed implementing a filter feature similar to those found on shopping websites. Our customer introduced the concept of relational database models, which opened my eyes to how filtering and data relationships work on a larger scale. Since integrating SQL with Firebase is not supported in the free tier, we opted to build a simpler filter system for now. However, this gave me the motivation to learn more about relational databases and SQL for future development.

For improvement, I think our team could benefit from having more consistent in-person collaboration to strengthen communication and alignment. Personally, I want to start my work earlier and commit changes more frequently. Balancing coursework with this project can be challenging, but I plan to manage my time more effectively to maintain steady progress throughout the next sprint.
