S1-T1: Outfit Planner

Sprint 4 Reflection

During this sprint, my primary individual contribution was redesigning and refining the home screen UI to align with our team's updated navigation strategy. After our customer meeting, we agreed that users should be greeted with the main planning feature, so I repositioned the "Add Clothing" and "View Closet" buttons from the top of the page to the bottom, aligning them horizontally for better accessibility and visual consistency. I also implemented a new "Home" button that allows users to return to the planning page from either the closet view or settings tab, improving navigation flow. Additionally, I focused on enhancing clarity by rewriting button labels using simple, concise language that's easy for users to understand at a glance. These changes were part of our broader team effort to integrate a new UI that supports persistent bottom navigation, allowing users to access key features from anywhere in the app.

One challenge I encountered was that the UI looked cramped when tested on smaller screens. To fix this, I adjusted spacing and layout elements to ensure everything remained readable and accessible across different device sizes. I also resolved some merge conflicts during integration, which required careful coordination with teammates to preserve everyone's contributions.

Through this sprint, I gained deeper insight into user-centered design and learned how small UI adjustments can significantly impact usability. I also improved my skills in Flutter layout management and navigation routing, especially in handling tab switching and persistent widgets.

Looking ahead, I believe I could improve by planning my UI changes more collaboratively with the team the earlier sprint. As a team, we could benefit from more structured design reviews before implementation to ensure consistency across screens. We've made strong progress, but with the settings page still pending, I'm excited to contribute to its development in the next sprint and help ensure it aligns with the rest of our app's design.
