

During this sprint, I worked on developing the Edit Tag feature for the closet screen. My main goal was to give users a more flexible way to manage and personalize their clothing items. I added an Edit Tags button to each clothing card that opens a bottom sheet interface, allowing users to view, edit, delete, or add tags directly within the closet. This gave the feature a more interactive and user-friendly experience, helping users to organize their items by categories such as color, brand, or material.

While working on this feature, I focused on maintaining a clean and consistent UI design that fits the app theme. I used Flutter components to make the editing process intuitive and visually appealing. I also used `setState()` to ensure that any tag updates instantly reflect in the closet view without needing to refresh.

One of the main challenges I faced was ensuring the bottom-sheet layout remained responsive across different screen sizes. It took several adjustments to get the alignment, spacing, and text wrapping to look right.
