

Abhiram Makkapati

In this sprint, I focused mainly on improving the Re-Wear feature in our StyleSync app. My main accomplishment was designing and implementing the Re-Wear button so users can quickly log an outfit or clothing item they wore again. I made sure the button matched our existing theme and looked clean in the layout. I also connected it to Firebase so that every time the user taps it, the wear history updates correctly in Firestore. Another thing I worked on was fixing some layout issues that appeared after previous edits. I carefully checked each screen to make sure nothing broke and that navigation continued to work smoothly. Overall, my contribution helped make the user experience faster and more consistent.

One challenge I faced was dealing with Firebase write operations. At first, the timestamps were not updating the way I expected. I had to go back and test multiple scenarios, such as logging the same item more than once and verifying the data in Firestore. I also struggled a bit with making the button fit correctly under the “View Closet” button without affecting the rest of the UI. I solved this by testing different placements and checking how it looked on multiple screen sizes.

During this sprint, I learned a lot about handling data updates in Firebase more efficiently. I also improved my understanding of UI consistency in Flutter and how small changes can affect the layout of other screens. Another important thing I learned was to double-check navigation paths, because even a small change in one file can affect other parts of the app.

If I could improve something, I would manage my time better so I don't rush at the end. I also want to write cleaner code comments so future edits are easier for me. Another improvement area is testing, I want to get better at catching UI issues earlier instead of noticing them after multiple builds. In the next sprint, I plan to be more organized and review my changes more thoroughly before pushing them.
