

SPRINT 5

During this sprint, I worked on the feature that allows users to click on a specific piece of clothing and view a list of all the dates that item was worn. This list displays the clothing's wear history in chronological order. When the user clicks on a specific date from the list, the app navigates to another screen that shows the entire outfit worn on that day, including all related items grouped by category.

One major challenge was connecting the clothing history data to the corresponding outfit details while keeping the UI responsive. Managing data retrieval from the service and ensuring that tapping a date correctly displays all associated items required careful handling of asynchronous data and stream updates.

During this sprint, I learned how to link different parts of the app through data-driven navigation, using `StreamBuilder` and `FutureBuilder` to handle live updates and asynchronous calls. I also improved my understanding of how to structure and present related data using lists, cards, and dynamic grouping in Flutter.
