Sprint 6 Reflection

During this sprint, my primary individual contribution was completing the view calendar feature for our project. I integrated a calendar function in Dart to generate the calendar layout, which eliminated the need to manually create dates and ensure consistency across months—a concern that was highlighted during our customer meeting. Using this function, I was able to hard-code the calendar to span ten years, providing a robust and flexible foundation for our application.

One of the main challenges I encountered was displaying images of planned outfits under specific calendar dates, as we initially did not have a saved feature implemented. Once the saved feature was added, I was able to link the stored outfit data to the calendar properly. Additionally, I worked on breaking the calendar view into multiple timeframes—weekly, bi-weekly, and monthly—so users could navigate their plans more intuitively. Another enhancement I implemented was the scrolling arrow for planned outfits on a single day, allowing users to pan through multiple outfits without losing sight of the calendar context. These improvements significantly enhanced the functionality and user experience of the calendar feature.

Through this sprint, I learned the importance of careful planning before implementation, particularly in defining which features are necessary. This upfront clarity helps minimize confusion and reduces the likelihood of encountering major challenges mid-development. I also gained further insight into problem-solving in code, understanding that encountering difficulties is normal and that patience, experience, and iterative testing are key to resolving them effectively.

Looking ahead, I see room for improvement in both my personal workflow and the team's process. Personally, I could allocate more time upfront to outline potential feature dependencies, which would make implementation smoother and reduce rework. For the team, we could benefit from better coordination on feature interdependencies, such as ensuring that foundational functionalities (like the save feature) are completed before dependent features are tackled. These adjustments could improve efficiency and reduce bottlenecks in future sprints.

Overall, this sprint was productive, and I am satisfied with the progress I made. I feel more confident in my technical skills and in my ability to anticipate challenges, which will help me contribute even more effectively in the next sprint.
