

Sprint 6

In this sprint, my main focus was completing the Re-Wear feature and making sure it worked smoothly with the rest of the app. I added the Re-Wear button, placed it in the correct screen, and connected it to Firestore so it updates the wear history with the right timestamp. I spent time testing the button multiple times to make sure it didn't break any navigation or create issues in other parts of the app. Along with this feature, I also fixed a few layout problems that appeared after recent changes. These fixes helped make the screens more consistent and kept the UI clean.

One of the challenges I faced was getting the Re-Wear logic to work properly with the history screen. At first, the feature was placed in the wrong area, and the data wasn't updating the way I expected. I had to go back, move the button to the correct screen, and adjust the Firestore write operations so it aligns with our existing structure. Another challenge was dealing with small UI issues that kept appearing after each test. I had to carefully check the screens again to make sure the new code didn't create conflicts.

This sprint taught me how important it is to understand the app's structure before adding new features. I learned more about connecting UI actions to Firestore, especially when writing data with timestamps. I also improved my ability to test my work properly instead of assuming everything works after one run. Debugging small layout issues also helped me get more comfortable with Flutter widgets and screen organization.

Looking back, one thing I could have improved is planning my work more clearly before jumping into the code. If I had mapped out where the button should go and how the logic should interact with the history screen earlier, I would have saved some time. In the next sprint, I want to be more organized and follow a clearer workflow so I can avoid unnecessary changes and re-testing. I also want to improve my debugging speed and continue strengthening my understanding of the app's structure.
